1. Product introduction

General description

The Grundfos Renewable Solar Inverter (RSI) is an off-grid solar inverter converting the DC power output from the solar panel to AC power supply for pump operation.

RSI can be used in both new and existing systems as long as the motor specifications are compatible and is suitable for use with a variable frequency drive.

The list below contains the Grundfos pump types for use in applications with RSI:

- CR
- SP
- NB, NK
- MTR
- CM
- TP.

Features and benefits

Enclosure class IP66

RSI is designed to achieve enclosure class IP66. This means the inverter is weather proof and can be installed outside.

Note: Installing the inverter underneath the solar array reduces the cable length to a minimum, reduces power losses and improves the safety conditions.

Setup wizard with Grundfos product library

RSI has a built-in Grundfos product library which allows a plug-and-pump experience. The motor library contains all related parameters that simplifies the setup process to just a few clicks and a setup time of a few minutes.

Detachable control panel

The control panel is mounted on RSI by a magnet and with a communication plug. The inverter can operate without the control panel and will operate with the last saved setup data.

AC/DC compatibility

RSI is AC and DC compatible. RSI can be connected to the grid or a generator as back-up power during solar panel disruptions.

The AC compatibility also allows the end user to connect the inverter to three-phase power in their workshop for off-site setup which enables a fast and simple on-site installation.

Maximum power point tracking (MPPT)

The inverter has built-in electronics with four MPPT algorithms. The inverter will continuously optimise according to available solar irradiation as well as various environmental conditions.

Overvoltage and undervoltage protection

Overvoltage and undervoltage may occur in case of faulty installation. The inverter will cut out the power connection to the motor if the voltage falls outside the allowed voltage limits. The inverter will stay in fault mode with the error code displayed on the inverter until the inverter is reset.

Overload protection

Overload may occur if the maximum allowed frequency is set too high or a wrong pump is used. The inverter will cut out the power connection to the motor if overload occurs. The inverter will stay in fault mode with the error code displayed on the inverter until the inverter is reset.

Overcurrent protection

Overcurrent may occur if, for example, a wrong cable size is used. The inverter will cut out the power connection to the motor if the current falls outside the allowed current limits. The inverter will stay in fault mode with the error code displayed on the inverter until the inverter is reset.

Note: For the overcurrent protection to function properly, the actual current value must be adjusted according to the maximum current attained at the maximum frequency shortly after the system started operation.

Overtemperature protection

The inverter may be overheated if appropriate ventilation is not available or the ambient temperature is too high. The inverter will cut out the power connection to the motor if overtemperature occurs in the inverter. The inverter will stay in fault mode with the error code displayed on the inverter until the inverter is reset.

Note: The inverter does not detect motor temperature or protect the motor against overtemperature.

No-load protection

No-load situation of the inverter may occur if, for example, the cable to the motor is broken. The inverter will cut out the power connection to the motor if no-load occurs. The inverter will stay in fault mode with the error code displayed on the inverter until the inverter is reset.

Note: For the no-load protection to function properly, please check the RSI installation and operating instructions carefully during the operation.

Operating history memory

The inverter will store historical operating data. The data can be retrieved through the menu on the inverter. The data can be retrieved for every minute of operation up to two years back.

2. Applications

RSI is designed for continuous as well as intermittent operation. The system is suitable for various water supply systems including irrigation.

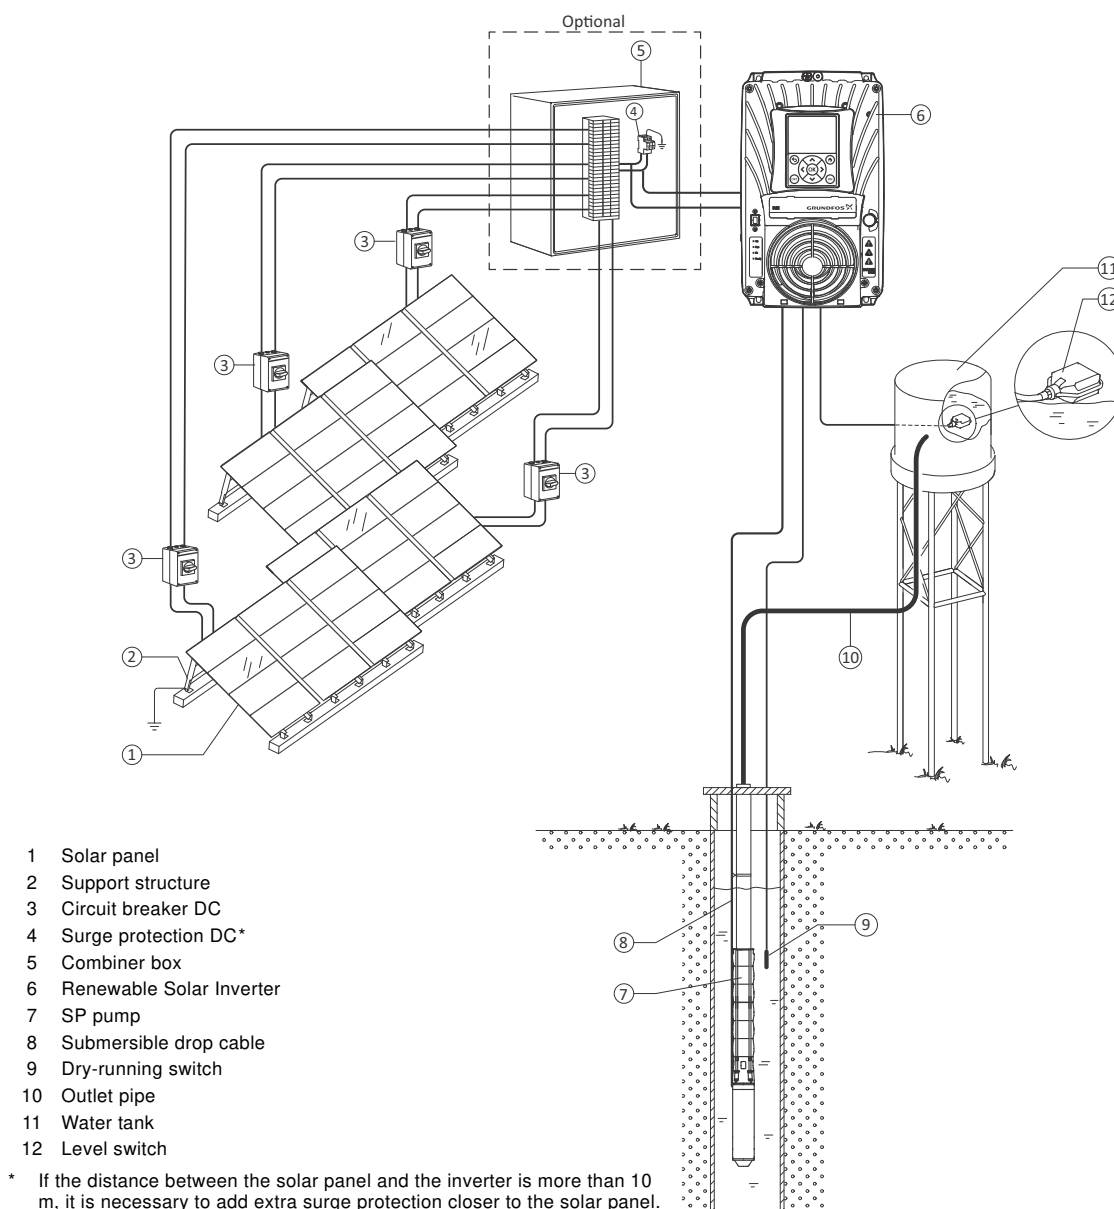

RSI can be used in existing systems with submersible pumps or dry-installed pumps, thus providing a very wide range of applications allowing you to leverage renewable energy sources with the ability to back up the system with grid or generator power.

Application example

The water production of an RSI system depends on the availability of solar power. The typical result is excess water production in the afternoon and insufficient water production in the morning and evening. A system equipped with a storage water tank will enable a stable water supply throughout the day.

In a combiner box all cables from the solar panels can be connected into one set of power input cables before connecting them to an RSI.

3. System components

An RSI system consists of a three-phase Grundfos motor, an RSI solar inverter, and various protection accessories.

The RSI system components include the following components:

- a Grundfos motor
- an RSI
- a circuit breaker, AC (optional)
- a circuit breaker, DC
- a surge protection, DC
- a solar panel
- a dry-running switch
- a level switch (optional)
- a sine wave filter (optional)
- a combiner box.

Pumps

Pump requirements for an RSI system:

- The rated frequency can be either 50 or 60 Hz.
- The pump must be able to operate with a voltage supply of 3 x 380 VAC or 3 x 220 VAC.

As standard, Grundfos three-phase pumps can only be operated via an AC voltage supply. Therefore, the solar panels must not be connected directly to the pump but must be connected via an RSI.

Renewable Solar Inverter

For a general product description, see section 1. *Product introduction*.

Fig. 3 RSI inverter

TM06 6678 1416

RSI combined with various sensors can offer the following functions:

- maximum power point tracking (MPPT)
- DC to three-phase AC conversion
- connection to dry-running switch
- connection to level switch
- operating history inquiry.

Circuit breaker, AC (optional)

An AC circuit breaker is a standard circuit breaker used for normal three-phase power connection between the RSI output and the motor.

Sine wave filter (optional)

A sine wave filter is primarily used for protecting the motor against overvoltage and increased operating temperature. Output filters can also be used for reduction of motor acoustics.

Solar panel

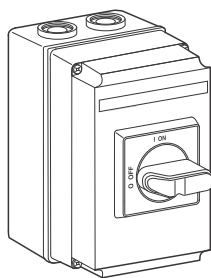

The solar panel offered by Grundfos is specially selected for Grundfos RSI.

All Grundfos solar panels are equipped with plugs and sockets enabling easy connection. The number of solar panels required depends on the water quantity required, water pressure required and installation location.

Dry-running switch

The dry-running switch is recommended for submersible pump operation. The switch can prevent the risk of the pump operating in a dry well, which could result in damage of the pump.

Circuit breaker, DC

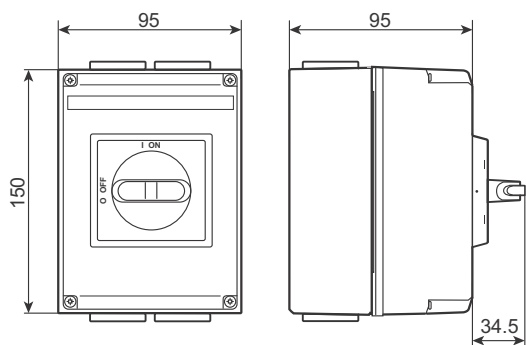

TM05 7581 1213

Fig. 4 Circuit breaker

The DC circuit breaker is suitable for the solar-powered RSI system.

The circuit breaker enables manual starting and stopping of the system. At least one DC circuit breaker is required for each set of solar panels connected in series to an RSI.

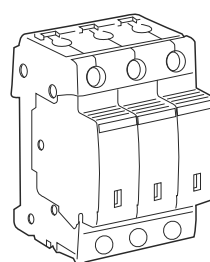

TM05 7585 1213

Fig. 5 Dimensions, circuit breaker

Combiner box (optional)

A combiner box combines the output of multiple solar panel arrays for connection to RSI, instead of having an array-to-array cable or exceeding the power range for the cable.

Surge protection, DC

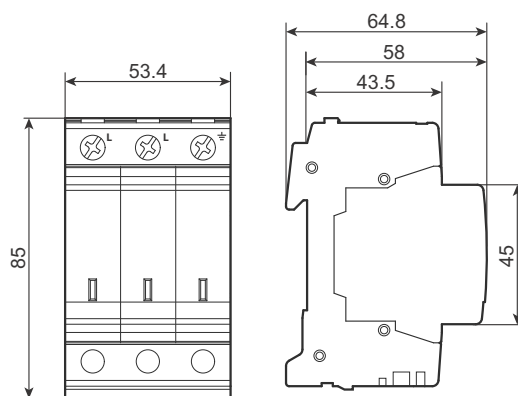

TM05 7582 1213

Fig. 6 Surge protection

The DC surge protection is suitable for the solar-powered RSI system.

The surge protection gives a very safe and reliable protection of the system by having a quick response. At least one DC surge protection is required for the DC input of RSI. We recommend also to have one DC surge protection for each solar array connected to a RSI.

Level switch (optional)

A level switch serves as a start/stop control that depends on the water level in the water tank.

7. Grundfos Product Center

Online search and sizing tool to help you make the right choice.

<http://product-selection.grundfos.com>

"SIZING" enables you to size a pump based on entered data and selection choices.

"REPLACEMENT" enables you to find a replacement product. Search results will include information on the following:

- the lowest purchase price
- the lowest energy consumption
- the lowest total life cycle cost.

The screenshot shows the Grundfos Product Center website. At the top, there's a navigation bar with the Grundfos logo and 'PRODUCT CENTER'. Below it, a search bar is labeled 'FIND PRODUCTS AND SOLUTIONS'. The main content area has four large buttons: 'SIZING' (with a subtext 'Enter pump sizing'), 'CATALOGUE' (with a subtext 'Products and services'), 'REPLACEMENT' (with a subtext 'Replace an old pump with a new'), and 'LIQUIDS' (with a subtext 'Find pump by liquid'). Below these, the 'QUICK SIZING' section is visible, featuring input fields for 'Flow (Q)*' and 'Head (H)*', dropdown menus for units, and radio buttons for 'Select what to size by' (Size by application, Size by pump design, Size by pump family). A 'START SIZING' button is also present. At the bottom, there's an 'ADVANCED SIZING' section with checkboxes for 'Advanced sizing by application' and 'Guided selection'.

"CATALOGUE" gives you access to the Grundfos product catalogue.

"LIQUIDS" enables you to find pumps designed for aggressive, flammable or other special liquids.

All the information you need in one place
